

Module description

for the degree programme

Master of Science Advanced
Optical Technologies

(Version of examination regulation: 20222)

for the summer term 2024

Table of contents

Basics of Laser (42105).....	5
Fundamentals of Optics (42101).....	7
Internship (1996).....	9
Master's thesis (1999).....	10
Numerical Methods and Topics in Optical Technologies (42110).....	12
Project report (1994).....	13
Optical Metrology	
Glass I (46228).....	15
Modern optics 1: Advanced optics (48311).....	17
Nonlinear optics (582360).....	19
Novel techniques in ultrafast spectroscopy (67009).....	21
Optical diagnostics in energy and process engineering (42935).....	23
Optical technologies in life science (45730).....	25
Product analysis (45370).....	28
Thermophysical properties of working materials in process and energy engineering (44960).....	30
Optical Material Processing	
Advanced Laser (42130).....	35
Engineering of solid state lasers (94930).....	37
Laser systems engineering 1 (95360).....	39
Lasersystemtechnik II (97283).....	41
Laser technology (97150).....	43
Laser tissue interaction (763337).....	45
Optical Lithography: Technology, Physical Effects and Modeling (42140).....	47
Scanning and printing in 3D (46100).....	49
Optics in Medicine	
Find the disease Case based teaching (746003).....	52
Fundamentals in anatomy and physiology for engineers (47664).....	53
Laser tissue interaction (763337).....	54
Light as a versatile tool in biology and biophysics (67124).....	56
Magnetic resonance imaging (122337).....	58
Magnetic resonance imaging 2 + exercise (568977).....	59
Medical Image Processing for Diagnostic Applications (44151).....	61
Medical Image Processing for Interventional Applications (44141).....	63
Optical technologies in life science (45730).....	65
Photonics for medical applications (47650).....	68
Photonics in medical engineering (47624).....	70
Photonics in Medical Engineering (42145).....	72
Optics in Communication	
Advanced nonlinear optics (67143).....	74
Advanced optical communication systems (621649).....	76
Arduino hardware and software for lab applications and beyond (67111).....	78
Biophysics of Cellular Building Blocks (67092).....	80
Linear and non-linear fibre optics (267499).....	82
Modern optics 3: Quantum optics (48313).....	84
Nonlinear optics (582360).....	86
Optical communication networks (849203).....	88
Quantum communication (67188).....	91
Waveguides, optical fibres and photonic crystal fibres (67145).....	92
Optical Materials and Systems	

Advanced Course in Experimental Physics: Lasers, Atomic Physics and Quantum Optics (42155).....	95
Advanced Laser (42130).....	97
Advanced nonlinear optics (67143).....	99
Advanced semiconductor technologies - Photovoltaic systems I - Fundamentals (46257).....	101
Glass I (46228).....	103
Glass II (46229).....	105
Modern optics 1: Advanced optics (48311).....	107
Nonlinear optics (582360).....	109
Optical Lithography: Technology, Physical Effects and Modeling (42140).....	111
Photovoltaics (PV) and PV Systems II: Light conversion and light management (46253).....	113
Photovoltaic systems - Fundamentals (42923).....	116
Theoretical methods for optical properties of solids (67134).....	118
Thermophysical properties of working materials in process and energy engineering (44960).....	120
Waveguides, optical fibres and photonic crystal fibres (67145).....	124
Computational Optics	
Computational Optics (43220).....	127
Computational photography and capture (43386).....	128
Computational visual perception (93173).....	130
Computer vision (713618).....	132
Implementations of Quantum Error Correction (67016).....	134
Medical Image Processing for Diagnostic Applications (44151).....	136
Medical Image Processing for Interventional Applications (44141).....	138
Pattern analysis (44120).....	140
Pattern recognition (44130).....	143
Quantum computing (67156).....	146
Seminar: Advanced algorithms in medical image processing (47643).....	148
Physics of Light	
Advanced Course in Experimental Physics: Lasers, Atomic Physics and Quantum Optics (42155).....	150
Advanced Laser (42130).....	152
Advanced nonlinear optics (67143).....	154
Biophysics of Cellular Building Blocks (67092).....	156
Modern optics 3: Quantum optics (48313).....	158
Nobel Prizes in theory of light and matter (67008).....	160
Nonlinear optics (582360).....	161
Novel techniques in ultrafast spectroscopy (67009).....	163
Quantum communication (67188).....	165
Quantum computing (67156).....	166
Theoretical methods for optical properties of solids (67134).....	168
Physics of Light	
Advanced experimental physics (66941).....	171
Advanced Programming Techniques (44171).....	175
Advanced theoretical physics (66961).....	177
Cognitive neuroscience for AI developers (44445).....	180
Data science survival skills (47677).....	182
Deep learning (901895).....	184
Functional analysis for engineers (43230).....	186
Introduction to machine learning (65718).....	187
Machine learning for engineers II: Advanced methods (95068).....	190

Machine learning for engineers I - Introduction to methods and tools (95067).....	192
Machine learning for physicists (668977).....	194
Methods of data analysis I (67172).....	196
Seminar machine learning and data analytics for industry 4.0 (903776).....	198
Theoretical physics 3: Quantum mechanics (66190).....	200
Lab courses major topic 1+2	
Laboratory course: Optics in medicine (42725).....	203
Laboratory course: Physics of light (42730).....	204

1	Module name 42105	Basics of Laser	5 ECTS
2	Courses / lectures	No teaching units are offered for the module in the current semester. For further information on teaching units please contact the module managers.	
3	Lecturers	-	

4	Module coordinator	Prof. Dr. Nicolas Joly	
5	Contents	<p>Laser technology developed enormously since its first demonstration in 1960. Although at that time laser was described as "a solution in search of a problem it is nowadays used everywhere, from high-precision spectroscopy to bar-scanner in supermarkets, from eye-surgery to metal welding for car industry. The lecture focuses on the basics of laser and serves as a first glance in the fascinating world of coherent light sources. It reviews four major aspects of lasers:</p> <p>(i) the description of the active material, which provides the gain for the system (ii) the laser cavity, which defines the spatial structure of the laser beam (iii) the propagation of laser beam using the ABCD matrices formalism and (iv) the different dynamical regimes of laser, in particular the way to generate pulses.</p> <p>Besides the lecture/exercises the students are invited to test the concepts seen during the lecture on two laser systems: a solid-state Nd:YAG laser and a Er-doped fibre laser.</p> <p>During lab exercises the students will work on concepts seen during the lecture on two laser systems: a solid-state Nd:YAG laser and a Er-doped fibre laser.</p>	
6	Learning objectives and skills	<p>Students will be able to:</p> <ul style="list-style-type: none"> • Describe the active material using the rate equations • Check the stability of a laser cavity and extract the beam parameters from the physical parameters of the cavity (length, radius of curvature of the mirrors etc.) • Use ABCD matrix to define the spatial properties of a laser beam and shape the beam (focusing, coupling etc.) • Align a laser cavity and observe the different spatial modes that can be generated • Understand the different dynamical behaviours of a laser (mode-locked laser, Q-switch laser, continuous). 	
7	Prerequisites	None	
8	Integration in curriculum	semester: 1	
9	Module compatibility	Pflichtmodul Master of Science Advanced Optical Technologies 20222	
10	Method of examination	Praktikumsleistung Klausur (90 Minuten)	

		At the end of the course there is a written exam (90 min). In addition the students have to write reports about two lab sessions.
11	Grading procedure	Praktikumsleistung (20%) Klausur (80%)
12	Module frequency	only in winter semester
13	Workload in clock hours	Contact hours: 60 h Independent study: 90 h
14	Module duration	1 semester
15	Teaching and examination language	english
16	Bibliography	"Laser by A.E. Siegman, University Science book, 1986 "Handbook of Lasers and Optics by F. Träger, Springer, 2007 "Les lasers by D.Dangoisse, D. Hennequin and V. Zehnlé)Dhaoui, Dunod 1998 "Principles of Lasers, 5th ed. by Orazio Svelto, Springer 2010

1	Module name 42101	Fundamentals of Optics	15 ECTS
2	Courses / lectures	No teaching units are offered for the module in the current semester. For further information on teaching units please contact the module managers.	
3	Lecturers	-	

4	Module coordinator	Prof. Dr.-Ing. Andreas Paul Fröba	
5	Contents	<p>*Optic and quantum phenomenons*</p> <p>*- Light as a wave*</p> <p>Wave nature of light, Maxwell equation, plan waves, spherical waves, monochromatic fields</p> <p>*-Light and matter*</p> <p>Light scattering, wave propagation, polarization and current density, modified Maxwell equations, modified wave equation, law of refraction, Fresnel equations, Brewster angle, total reflection, polarization of material</p> <p>*- Geometrical optics*</p> <p>Ray optics, ray transfer matrix analysis, principal planes, aberrations, optical resonators</p> <p>*-Diffraction and interferenz*</p> <p>HuygensFresnel principle, Fraunhofer diffraction, microscopes, telescopes, resolution limit, imaging techniques, humand eye, polarization of electromagnetic fields, plain waves in homogenous material, birefringence, polarized elements</p> <p>*-Basic experiment in quantum phenomenons *</p> <p>Particle characteristics of light, photoelectric effect, black-body radiation, compton effect, wave nature of particles, wave nature of electrons</p> <p>*-Basic equations of quantum mechanics*</p> <p>Schrödinger equation, time-independent Schrödinger equation, wave function, particle in a box, tunnel effect</p> <p>*-Specialization*</p> <p>Advanced Molecular Spectroscopy</p>	
6	Learning objectives and skills	<p>Students should be able</p> <ul style="list-style-type: none"> to describe and explain the experimental basics and the mathematical description of optic and quantum phenomena apply laws of physics and mathematical methods to actual problems 	
7	Prerequisites	None	
8	Integration in curriculum	semester: 1	
9	Module compatibility	Pflichtmodul Master of Science Advanced Optical Technologies 20222	
10	Method of examination	Klausur (150 Minuten)	
11	Grading procedure	Klausur (100%)	
12	Module frequency	only in winter semester	
13	Workload in clock hours	Contact hours: 150 h Independent study: 300 h	

14	Module duration	1 semester
15	Teaching and examination language	english
16	Bibliography	

1	Module name 1996	Internship (M.Sc. Advanced Optical Technologies 20222) Internship	5 ECTS
2	Courses / lectures	No courses / lectures available for this module!	
3	Lecturers	No lecturers available since there are no courses / lectures for this module!	

4	Module coordinator	Dr. Jürgen Grossmann	
5	Contents	Students do an internship of five weeks full time (or an equivalent time part time) at an institute of the university, at another research institute or in the industry.	
6	Learning objectives and skills	During the internship students learn how to work in an organisation in the field of optical technologies.	
7	Prerequisites	None	
8	Integration in curriculum	semester: 2	
9	Module compatibility	Pflichtmodul Master of Science Advanced Optical Technologies 20222	
10	Method of examination	Studienleistung Students have to submit the confirmation that they have done the internship and write a small report about their activities (2-3 pages). The internship is not graded.	
11	Grading procedure	Studienleistung (0%) Not graded	
12	Module frequency	every semester	
13	Resit examinations	The exams of this moduls can only be resit once.	
14	Workload in clock hours	Contact hours: 0 h Independent study: 150 h	
15	Module duration	1 semester	
16	Teaching and examination language	german or english	
17	Bibliography		

1	Module name 1999	Master's thesis (M.Sc. Advanced Optical Technologies 2022) Master's thesis	30 ECTS
2	Courses / lectures	No courses / lectures available for this module!	
3	Lecturers	No lecturers available since there are no courses / lectures for this module!	

4	Module coordinator	Dr. Jürgen Grossmann	
5	Contents	<p>The students</p> <ul style="list-style-type: none"> - independently pursue a scientific question of the corresponding subject area over a longer period of time and work on it within a given time limit. (Focus on self-competence/subject competence) - develop independent ideas and concepts to solve scientific scientific problems. (Focus on methodological competence/specialist competence) - deal with theories, terminologies, special features, limits and doctrines of the subject in an in-depth and critical manner and reflect on them. and reflect on them. (Focus on professional competence/self-competence) - apply and further develop appropriate scientific methods largely independently - also in new and unfamiliar as well as interdisciplinary contexts. (Focus methodological competence). - can present subject-related content clearly and appropriately to the target group in writing (and, if necessary, orally) and defend it argumentatively. (focus on social competence/specialist competence) - expand their planning and structuring abilities in the implementation of a thematic project. (focus on methodological competence/specialized competence). <p>Please adapt the competencies to the professional requirements or expand them accordingly. Please note that theses written at other universities or in similar courses of study must be credited if they are equivalent. A precise module description helps to make the process of credit transfer (also the decision of non-credit transfer) transparent and to facilitate it for all parties involved.</p>

1	Module name 42110	Numerical Methods and Topics in Optical Technologies	5 ECTS
2	Courses / lectures	No teaching units are offered for the module in the current semester. For further information on teaching units please contact the module managers.	
3	Lecturers	-	

4	Module coordinator	Prof. Dr.-Ing. Bernhard Schmauß
5	Contents	The module introduces the topics which can be chosen as major topics in the second and third semester of MAOT and the use of the software Matlab (or another numerical tool for the analysis of data).
6	Learning objectives and skills	Students <ul style="list-style-type: none"> do understand the basic concept of Matlab do know the basic functions of Matlab are able to apply Matlab for solving numerical problems in the field of optics know different application fields of optical technologies are able to decide about their major topics for the second and third term
7	Prerequisites	None
8	Integration in curriculum	semester: 1
9	Module compatibility	Pflichtmodul Master of Science Advanced Optical Technologies 20222
10	Method of examination	Studienleistung Students have to <ul style="list-style-type: none"> produce two presentations (15-25 page) about two of the seven majors as a group work (in groups of 4-6 students) do several small Matlab exercises (1-2 pages code) and a more comprehensive project (4-7 pages) Both achievements are not graded.
11	Grading procedure	Studienleistung (0%)
12	Module frequency	only in winter semester
13	Workload in clock hours	Contact hours: 60 h Independent study: 90 h
14	Module duration	1 semester
15	Teaching and examination language	english
16	Bibliography

1	Module name 42130	Advanced Laser	5 ECTS
2	Courses / lectures	Vorlesung mit Übung: Advanced Laser (4.0 SWS)	5 ECTS
3	Lecturers		

4	Module coordinator	Prof. Dr. Nicolas Joly
5	Contents	<p>This module naturally follows the "Basics of Lasers module and aims at deepen the knowledge on a few specific aspects of lasers. In particular we will study the Z-cavity of one of the most popular laser system: the Titanium: sapphire laser. The purpose here is to show why simpler cavity is not possible. It requires understanding properly the concept of stability of laser cavity and introduces the problem of astigmatism. In a second stage we see how dispersion effects can hamper the properties of a mode-locked laser system and see how to circumvent this. We then study the different method used to characterize ultrashort laser pulse. This starts from basics concepts of autocorrelation but review more advanced techniques allowing to retrieve fully the amplitude and phase of a laser pulse.</p> <p>Towards the end of the lecture several topics are possible and it will be chosen together with the students. This can be for instance (i) the polarization and the Jones formalism (ii) the Maxwell-Bloch equations (iii) the origin of spontaneous emission. Finally in order to broaden the contents of the lecture the students are asked to prepare one half-an-hour presentation of the topics of their choice. The topics are discussed during the first two sessions of the lecture and must focus on a physical aspect of laser.</p>
6	Learning objectives and skills	<p>Students</p> <ul style="list-style-type: none"> • Understand the problem of dispersion in a laser cavity and establish a strategy to balance this problem in order to achieve transform-limited ultrashort pulses • Estimate the duration of a laser pulse and adapt the technique to the level of precision required • Understand the design of laser cavities

5	Contents	<p>Semiconductor lithography covers the process of pattern transfer from a mask/layout to a photosensitive layer on the surface of a wafer. It is one of the most critical steps in the fabrication of microelectronic circuits. The majority of semi-conductor chips are fabricated by optical projection lithography. Other lithographic techniques are used to fabricate lithographic masks or new optical and mechanical devices on the micro- or nanometer scale. Innovations such as the introduction of optical proximity correction (OPC), phase shift masks (PSM), special illumination techniques, chemical amplified resist (CAR) materials, immersion techniques have pushed the smallest feature sizes, which are produced by optical projection techniques, from several wavelengths in the early 80ties to less than a quarter of a wavelength nowadays. This course reviews different types of optical lithographies and compares them to other methods. The advantages, disadvantages, and limitations of lithographic methods are discussed from different perspectives. Important components of lithographic systems, such as masks, projection systems, and photoresist will be described in detail. Physical and chemical effects such as the light diffraction from small features on advanced photomasks, image formation in high numerical aperture systems, and coupled kinetic/diffusion processes in modern chemical amplified resists will be analysed. The course includes an in-depth introduction to lithography simulation which is used to devise and optimize modern lithographic processes.</p>
6	Learning objectives and skills	<p>The students</p> <ul style="list-style-type: none"> • understand the principles of optical projection lithography • understand how optical and material-driven resolution enhancements work • get an introduction to Extreme Ultraviolet (EUV) lithography • get an overview on alternative lithographic techniques • get an introduction to computational lithography • discuss the role of nanoscale light scattering effects

5	Contents	In this module, the physical and technical basics of MRI are taught in detail. The principles of data acquisition are explained and various examples are shown. Imperfections in the data acquisition lead to image artifacts that cannot be avoided in all cases. Strategies for detecting and avoiding image artifacts are explained. One of the great strengths of MRI in medical diagnostics is the ability to acquire images with different contrasts. The origin of the frequently used T1 and T2 weighted image contrasts is discussed in detail. Various MRI sequence techniques are also discussed."
6	Learning objectives and skills	The participants <ul style="list-style-type: none"> • understand the principles, properties and limits of basic MRI techniques • develop the ability to choose an appropriate basic MRI sequence and to set up the corresponding sequence parameters for a range of basic applications • are able to explain MRI techniques, algorithms and concepts of the lecture to other engineers.

5	Contents	<p>English Version:</p> <p>This module focuses on recent developments in image processing driven by medical applications. All algorithms are motivated by practical problems. The mathematical tools required to solve the considered image processing tasks will be introduced. The module starts with an overview on preprocessing algorithms such as scatter correction for x-ray images, edge detection, super-resolution and edge-preserving noise reduction. The second chapter describes automatic image analysis using feature descriptors, key point detection, and segmentation using bottom-up algorithms such as the random walker or top-down approaches such as active shape models. Furthermore, the module covers geometric calibration algorithms for single view calibration, epipolar geometry, and factorization. The last part of the module covers non-rigid registration based on variational methods and motion-compensated image reconstruction.</p> <p>Deutsche Version:</p> <p>Das Modul ist auf die jüngsten Entwicklungen in der Verarbeitung von medizinischen Bildern ausgerichtet. Alle Algorithmen werden durch praktische Probleme motiviert. Die mathematischen Werkzeuge, die für die Bildverarbeitungsaufgaben benötigt werden, werden eingeführt. Das Modul beginnt mit einem Überblick über Vorverarbeitungsalgorithmen, wie zum Beispiel Streustrahlkorrektur für Röntgenbilder, Kantenerkennung, Superresolution und kantenerhaltende Rauschunterdrückung. Das zweite Kapitel beschreibt die automatische Bildanalyse mit Merkmalsdeskriptoren, Punkterkennung und Segmentierung mit Bottom-up-Algorithmen wie dem Random-Walker oder Top-Down-Ansätzen wie aktiven Formmodellen. Darüber hinaus deckt die Vorlesung auch geometrische Kalibrierungsalgorithmen zur Einzelansicht-Kalibrierung, Epipolargeometrie und Faktorisierung ab. Der letzte Teil des Moduls deckt nicht-starre Registrierung auf der Grundlage von Variationsmethoden und bewegungskompensierter Bildrekonstruktion ab.</p>	
6	Learning objectives and skills	<p>English Version:</p> <p>The participants</p> <ul style="list-style-type: none"> summarize the contents of the lecture. 	

		<ul style="list-style-type: none"> • apply pre-processing algorithms such as scatter correction and edge-preserving filtering. • extract information from images automatically by image analysis methods such as key point detectors and segmentation algorithms. • calibrate projection geometries for single images and image sequences using the described methods. • develop non-rigid registration methods using variational calculus and different regularizers. • adopt algorithms to new domains by appropriate modifications. <p>Deutsche Version: Die Teilnehmenden</p> <ul style="list-style-type: none"> • fassen die Inhalte der Vorlesung zusammen. • wenden Vorverarbeitungsalgorithmen wie Streustrahlkorrektur und kantenerhaltende Filterung an. • extrahieren automatisch Informationen aus Bildern, indem sie Bildanalyseverfahren wie Punktdetektoren und Segmentierungsalgorithmen verwenden. • kalibrieren Projektionsgeometrien für Einzelbilder und Bildsequenzen mit den beschriebenen Methoden. • entwickeln nicht-starre Registrierungsmethoden mit Hilfe von Variationsrechnung und unterschiedlichen Regularisierern. • wenden Algorithmen auf neue Modalitäten durch entsprechende Änderungen im Algorithmus an.

5	Contents	<p>Das Modul behandelt spezialisiert medizintechnische Anwendungen der Photonik.</p> <p>Zunächst wird die Lichtausbreitung in biologischem Gewebe beschrieben und diskutiert. Ein weiterer Abschnitt behandelt die Wechselwirkung zwischen Licht und Gewebe, wobei die einzelnen Wechselwirkungsmechanismen auch an Beispielen der medizintechnischen Praxis vertieft werden. Hier sind stellvertretend zu nennen: Photodynamische Therapie, Photokoagulation, Laser-in-situ-Keratomiileusis (LASIK). Ein weiterer Themenschwerpunkt ist die Diskussion entsprechender diagnostische Verfahren. Hier wird beispielsweise aus spektroskopische Verfahren und auf Diagnoseverfahren die auf Fluoreszenz basieren detailliert eingegangen. Entsprechende Konzepte von Diagnosegeräten wie Endoskope, konfokale Mikroskope, Optische Kohärenztomographie (OCT), faserbasierte Sensoren und Biochipsensoren werden in einem weiteren Abschnitt vertieft. Ein aktueller Forschungsbezug wird im letzten Kapitel, das photonische Systeme in der Ophthalmologie behandelt, hergestellt.</p> <p>Die Lehrveranstaltung des Moduls teilt sich auf in einen Vorlesungsteil sowie einen Übungsteil, in dem die Studierenden durch eigene Beiträge (angeleitete Literaturrecherche, Kurzvorträge und Praxisprojekte) die Inhalte der Vorlesung vertiefen.</p>	
6	Learning objectives and skills	<p>Die Studierenden</p> <ul style="list-style-type: none"> • besitzen spezialisiertes und vertieftes Wissen der medizintechnische Anwendungen der Photonik, insbesondere der im Inhalt genannten Themengebiete. • können technische und wissenschaftliche Anwendungen der Photonik diskutieren, beurteilen und vergleichen. • sind in der Lage, ihre theoretischen Kenntnisse zur Photonik und Lasertechnik im Bereich der Medizintechnik vergleichend einzusetzen und so neue Verfahren und Konzepte zu entwickeln und auszuarbeiten. • können eigenständige Ideen und Konzepte zur Lösung wissenschaftlicher und technischer Probleme der Medizintechnik mit photonischen Systemen entwickeln. 	
7	Prerequisites	*Voraussetzungen:*	

		<ul style="list-style-type: none"> • Für Studenten im Master-Studium. • "Photonik 1", oder anderweitig erworbene fundierte Kenntnisse im Bereich Optik, Photonik und Lasertechnik.

5	Contents	<p>Please check StudOn for registration and further information: Link to StudOn-Entry</p> <p>Nowadays, microcontrollers are the centerpieces of electronics in almost any device, including washing machines, vending machines, several parts of any car and, increasingly, in smart home applications. With processor, memory and peripherals in one chip, they represent a full-fledged computer in miniature, and some of them can be bought for just a few cents. This is why these controllers are very relevant for scientists as well. Specially in research laboratories, individual and quick solutions for controlling mechanics and devices for data logging are highly desired.</p> <p>A very suitable introduction to working with microcontrollers is the Arduino platform. With standardized hardware boards and its own development environment based on the programming language C, the main focus of Arduino is on the rapid realization of new and individual projects. Numerous code libraries and compatible hardware extensions such as WIFI boards, SD card slots, various sensors, smartphone interaction and much more enable complex projects even for beginners.</p> <p>The scope of the two-week course “Arduino hard- and software for lab applications and beyond” reaches from the understanding of basic hardware components and electronics to the implementation of a multitude of libraries and modules. In addition to theoretical lectures, each group of two to three students will work on hard- and software every day. In the last few days of the course, the students apply their knowledge in an own project of their choice. Thereby, first ideas to lab automation can be implemented.</p>
6	Learning objectives and skills	<p>The students gain sound qualification in designing and realizing complex hard- and software projects using microcontrollers based on Arduino, including:</p> <ul style="list-style-type: none"> • Basics of electronics and microcontrollers • Communication of microcontrollers • Analog and digital signals • Finite-state machine • Sensors, modules, shields • Software libraries

		<ul style="list-style-type: none"> • Displays • Smartphone connection

5	Contents	Optical data transmission systems are the enabler for our modern communication networks. Since the first systems have been installed, the transmission capacity as well as the transmission distance has been increased dramatically. The migration from point-to-point transmission systems to complex optical networks is still in progress. The fast evolution of optical transmission technology is stimulated by innovations in the field of the system key components. The lectures concentrate on the physical effects and properties of key components like semiconductor lasers, optical modulators, optical fibers, optical amplifiers and detector diodes. Especially also the nonlinear effects of the transmission fiber are discussed. The main focus is on the effects and characteristics which are important to achieve a certain system performance. The influence of component parameters on system performance is presented in examples related to installed systems and systems that are actually in development. The exercises partly use a numerical simulation tool to analyze the component influence on system performance.
6	Learning objectives and skills	Students <ul style="list-style-type: none"> • Understand structure and operation of components of optical communication systems • Rate the optical properties of components and evaluate the influence of operational parameters on system performance • Are able to analyze the influence of linear and nonlinear fiber effects on optical signals and system performance • Can make use of system simulation tools to engineer optical links

5	Contents	<p>Global communication between billions of subscribers utilizing a multitude of devices is accomplished over a trans-continental fiber-optic transport network. End users worldwide access this network over copper cable (xDSL, HFC), by wireless technologies like WLAN, GSM, UMTS, LTE and also via GPON, EPON and WDM-PON (PON: Passive Optical Network). After a short distance ("the last mile") data streams from many users are aggregated (e.g. by IP routers) into higher data rate transport streams, which are then carried over cost-efficient and highly reliable optical connections.</p> <p>Rapid increase of data traffic has quickly evolved from Gigabit Ethernet (1GbE) to 10GbE and 100GbE data rates.</p> <p>To operate optical networks on a global scale, standards like OTN (Optical Transport Network) have been developed to provide high capacity links by use of many wavelengths together with operations and maintenance (OAM) functions. Automated protection and restoration schemes provide a high level of availability and can guarantee carrier-grade Quality of Service (QoS). Future data rate increase will be driven by video streaming as well as the introduction of 5G wireless technology and the Internet of Things (IoT).</p> <p>The course shall provide a fundamental understanding of modern fiber optic networks from fixed and mobile access through metropolitan area to core networks.</p> <ol style="list-style-type: none"> 1) Introduction – Evolution of optical networks 2) Network layers - Internet Protocol – TCP/IP 3) Label switching – MPLS – MPLS-TP 4) Quality of Service - traffic classification – resource allocation 5) Ethernet - switching and physical transport 6) Optical Transport Network - OTN 7) Optical fiber properties – optical amplification 8) Optical transmitter – laser – modulator 9) Optical receiver – photo detection – Clock&Data recovery – Bit Error Ratio calculation 10) Modulation formats – transmission - margin allocation 11) Coherent detection – optical signal processing 12) Optical networks – optical switching 13) Network control & automation 	
6	Learning objectives and skills	<p>Students ...</p> <ul style="list-style-type: none"> • explain the functional building blocks of optical networks 	

		<ul style="list-style-type: none"> • can elaborate on the different tasks provided by the logical/control plane (routing), the physical layer and transmission/data plane of optical networks • refer which standardisation organisation contributes to the different function of optical networks • explain the purpose of different protocols that interact along an end-to-end communication channel • describe technologies for E/O and O/E conversion and optical switches • express the design challenges of future optical systems for fixed and mobile access, data center interconnects, metro-regional, core, ultra-long-haul and submarine networks

5	Contents	<p>This module naturally follows the "Basics of Lasers module and aims at deepen the knowledge on a few specific aspects of lasers. In particular we will study the Z-cavity of one of the most popular laser system: the Titanium: sapphire laser. The purpose here is to show why simpler cavity is not possible. It requires understanding properly the concept of stability of laser cavity and introduces the problem of astigmatism. In a second stage we see how dispersion effects can hamper the properties of a mode-locked laser system and see how to circumvent this. We then study the different method used to characterize ultrashort laser pulse. This starts from basics concepts of autocorrelation but review more advanced techniques allowing to retrieve fully the amplitude and phase of a laser pulse.</p> <p>Towards the end of the lecture several topics are possible and it will be chosen together with the students. This can be for instance (i) the polarization and the Jones formalism (ii) the Maxwell-Bloch equations (iii) the origin of spontaneous emission. Finally in order to broaden the contents of the lecture the students are asked to prepare one half-an-hour presentation of the topics of their choice. The topics are discussed during the first two sessions of the lecture and must focus on a physical aspect of laser.</p>
6	Learning objectives and skills	<p>Students</p> <ul style="list-style-type: none"> • Understand the problem of dispersion in a laser cavity and establish a strategy to balance this problem in order to achieve transform-limited ultrashort pulses • Estimate the duration of a laser pulse and adapt the technique to the level of precision required • Understand the design of laser cavities
7	Prerequisites	None

5	Contents	Lecture / Exercise / Lab work The lecture will introduce into the fundamentals of photovoltaic energy conversion. The conversion of light into electricity is one of the most efficient power technologies by today and is expected to transform our energy system towards a renewable scenario. The limits of photovoltaic energy conversion, the materials and architectures of major PV technologies and advanced characterization methods for modules as well as solar fields will be introduced theoretically and experimentally during the lecture, a seminar and the lab works.
6	Learning objectives and skills	<ul style="list-style-type: none"> The students will learn the concept of black body radiation and the radiation laws and the limits of light energy conversion. The fundamental semiconductor junctions (p-n, M-i-M, Shottky and Hetero Junction) are repeated. The one diode and two diodes replacement circuits are explained. Electrical, optical, recombination and extraction loss mechanisms are discussed separately and demonstrated at the hand of numerical drift-diffusion equation solvers. The most important solar cell concepts (Si, CIGS, CdTe, GaAs, Perovskites, Organics) are introduced, and the strengths and weaknesses of each technology are analysed. Characterization of Photovoltaic Modules will be trained by flashed measurements in the lab. Defect imaging methods like DLIT, EL or PL imaging will be trained at the hand of module installations in Erlangen.

5	Contents	<p>Glass formulation using project management: Intensive exercise of 6 half days at the end of the semester. The teaching follows an "on time approach. After presentation of the case study, an introduction to the project management is given. Analytical tools are given to the students than can use them directly on the case study. The project is then defined through brainstorming followed by Solution analysis and quotation. The rules for scheduling, monitoring and controlling a project are introduced before the case study is started to be solved. An emphasis is given on reporting by quick presentation at the end of each half day by the project team. In conclusion a last time is taken to analyze the personal issues encounter during these six half days. That help the students to have a pragmatic thinking about what could have been a better project team and the need of a leader.</p> <p>Glass and Ceramic for Energy-technology:</p> <ul style="list-style-type: none"> • Materials and energy • Solar Energy • Solar Thermal • Photovoltaic Energy • Insulation • Wind Energy • Nuclear waste glass storage • Energy in glass processing • Fuel Cell and Ion conductivity • Lighting LED and LASER REE technology

3	Lecturers	PD Dr. Andreas Erdmann	

4	Module coordinator	PD Dr. Andreas Erdmann
5	Contents	<p>Semiconductor lithography covers the process of pattern transfer from a mask/layout to a photosensitive layer on the surface of a wafer. It is one of the most critical steps in the fabrication of microelectronic circuits. The majority of semi-conductor chips are fabricated by optical projection lithography. Other lithographic techniques are used to fabricate lithographic masks or new optical and mechanical devices on the micro- or nanometer scale. Innovations such as the introduction of optical proximity correction (OPC), phase shift masks (PSM), special illumination techniques, chemical amplified resist (CAR) materials, immersion techniques have pushed the smallest feature sizes, which are produced by optical projection techniques, from several wavelengths in the early 80ties to less than a quarter of a wavelength nowadays. This course reviews different types of optical lithographies and compares them to other methods. The advantages, disadvantages, and limitations of lithographic methods are discussed from different perspectives. Important components of lithographic systems, such as masks, projection systems, and photoresist will be described in detail. Physical and chemical effects such as the light diffraction from small features on advanced photomasks, image formation in high numerical aperture systems, and coupled kinetic/diffusion processes in modern chemical amplified resists will be analysed. The course includes an in-depth introduction to lithography simulation which is used to devise and optimize modern lithographic processes.</p>
6	Learning objectives and skills	<p>The students</p> <ul style="list-style-type: none"> • understand the principles of optical projection lithography • understand how optical and material-driven resolution enhancements work • get an introduction to Extreme Ultraviolet (EUV) lithography • get an overview on alternative lithographic techniques • get an introduction to computational lithography • discuss the role of nanoscale light scattering effects

2	Courses / lectures	No teaching units are offered for the module in the current semester. For further information on teaching units please contact the module managers.	
3	Lecturers	-	

4	Module coordinator	Prof. Dr. Christoph Brabec	
5	Contents	The lecture will introduce to the fundamentals of photovoltaic energy conversion. The conversion of light into electricity is one of the most efficient power technologies of today and is expected to transform our energy system towards a renewable scenario. The limits of photovoltaic energy conversion, the materials and architectures of major PV technologies and advanced characterization methods for modules as well as solar fields will be introduced theoretically and experimentally during the lecture and exercises.	
6	Learning objectives and skills	<ul style="list-style-type: none"> The students will learn the concept of black body radiation and the radiation laws and the limits of light energy conversion. The fundamental semiconductor junctions (p-n, M-i-M, Schottky and Hetero Junction) are repeated. The one diode and two diodes replacement circuits are explained. Electrical, optical, recombination and extraction loss mechanisms are discussed separately and demonstrated at the hand of numerical drift-diffusion equation solvers. The most important solar cell concepts (Si, CIGS, CdTe, GaAs, Perovskites, Organics) are introduced, and the strengths and weaknesses of each technology are analysed. Characterization of Photovoltaic Modules will be trained by flashed measurements in the lab. Defect imaging methods like DLIT, EL or PL imaging will be trained at the hand of module installations in Erlangen. 	
7	Prerequisites	None

5	Contents	<p>How do humans perceive the visual world? How can we build computational models to mimic this human perception? And how can we validate those computational models? This course is designed as an introduction to enable you to build computational models for human visual perception. It will therefore provide an introduction into the human visual system building on the course on cognitive neuroscience for AI developers. You will learn how the human eye and brain process visual input and what we currently know about the ventral visual stream. We will look at computational models for all different levels of visual processing and discuss how well they measure behavioral data. This lecture is designed to be at the intersection of Computer Science (Computer Vision and Graphics) and Cognitive Neuroscience.</p> <p>After an initial introductory phase, you will in small teams (1-3 students) perform a project to build prototypes for computational models for visual processing, reproduce recent scientific results or experiment with existing models.</p> <p>In addition to the project phase we will read and discuss recent research papers studying potential computational models and investigate how we can evaluate computational models.</p> <p>Please sign up via studon</p>
6	Learning objectives and skills	<p>By the end of this course, students will be able to</p> <ul style="list-style-type: none"> • Describe the basic processing steps of visual input in the human brain • Build a computational model for a known processing step • Read recent papers in the discipline and design a follow-up experiment • Choose/design and conduct a small research project • Choose adequate methods to evaluate a computational model • Work in and manage projects

5	Contents	This lecture discusses important algorithms from the field of computer vision. The emphasis lies on 3-D vision algorithms, covering the geometric foundations of computer vision, and central algorithms such as stereo vision, structure from motion, optical flow, and 3-D multiview reconstruction. Participants of this advanced course are expected to bring experience from prior lectures either from the field of pattern recognition or from the field of computer graphics.
6	Learning objectives and skills	<p>Die Vorlesung stellt eine Auswahl von Methoden aus dem Gebiet der Computer Vision vor, die in dem Feld eine zentrale Stellung einnehmen. In den Übungen implementieren und evaluieren die Studierenden selbständig diese Methoden. Die Studierenden arbeiten die ganze Zeit über an populären Computer Vision-Methoden wie zum Beispiel Stereosehen, optischer Fluss und 3D-Rekonstruktion aus mehreren Ansichten. Für diese Probleme</p> <ul style="list-style-type: none"> • beschreiben die Studierenden perspektivische Projektion, Rotationen und verwandte geometrische Grundlagen, • erklären die Studierenden die behandelten Methoden, • diskutieren die Studierenden Vor- und Nachteile verschiedener Modalitäten zur Erfassung von 3D-Informationen, • implementieren die Studierenden einzeln und gemeinschaftlich in Kleingruppen Code, • entdecken die Studierenden optimale Vorgehensweisen in der Datenaufnahme, • erkunden und bewerten die Studierenden unterschiedliche Möglichkeiten für die Evaluation, • diskutieren und präsentieren die Gruppenarbeiter in Gruppen die Vor- und Nachteile ihrer Implementierungen, • diskutieren und reflektieren die Studierenden gesellschaftliche Auswirkungen von Anwendungen des 3D-Rechnersehens. <p>The lecture introduces computer vision algorithms that are central to the field. In the exercises, participants autonomously implement and evaluate these algorithms. The participants work throughout the time on popular computer vision algorithms, like for example stereo vision, optical flow, and 3-D multiview reconstruction. For these problems, the participants</p> <ul style="list-style-type: none"> • describe perspective projection, rotations, and related geometric foundations, • explain the presented methods,

		<ul style="list-style-type: none"> • discuss the advantages and disadvantages of different modalities for acquiring 3-D information, • implement individually and in small groups code, • discover best practices in data acquisition, • explore and rank different choices for evaluation, • discuss and present in groups the advantages and disadvantages of their implementations, • discuss and reflect the social impact of applications of computer vision algorithms.

5	Contents	<p>What is photonic machine learning and why does it exist?</p> <p>Artificial neural networks (ANNs) have emerged as a powerful tool, which are for example used to accelerate medical research and for language processing. The freedom and power gained through the complexity of ANNs comes with the cost of a computational intense model training, eventually leading to a high energy consumption. For instance, the training of the recently published and much discussed large-language model ChatGPT 4 cost more than 100 million dollars. A reason for those high cost of ANNs is the underlying computing hardware, which is based on a von Neumann architecture, which simplifies means the separation of memory and processing units. As consequence, researchers study more specific beyond von Neumann architectures specifically designed for machine learning and deep learning applications.</p> <p>One possible solution to overcome the current limitations, could be the transfer of electrical ANNs into the optical domain. The resulting optical neural networks (ONNs) have attracted great interest over the last decades due to their promises of high processing speed, broad bandwidth, and low dissipative losses. Especially the collapse of many computational steps into a single process, which is natural in most ONNs, strongly increases the computational efficiency. Thus, ONNs are considered to path the way towards energy efficient and highly parallel optical circuits, which will have a significant impact on the performance and capabilities of future artificial neural networks. Multiple publications have demonstrated the capabilities of ONNs already.</p> <p>What are we going to discuss?</p> <p>The aim of the seminar is to give the audience an overview of the photonic machine learning community. How detailed this overview is, of course, depends on the number of participants. In general, we would select the topics from the following categories:</p>

		<ul style="list-style-type: none"> - Optical fully-connected feedforward neural networks - Optical reservoir computing and other extreme learning machines - Photonic neural networks for image classification - Photonic neural networks for language classification, e.g., optical transformers - Limits of photonic neural networks and approaches beyond photonics
6	Learning objectives and skills	<p>Goal of the seminar</p> <ul style="list-style-type: none"> • Overview of cutting-edge science Participants are exposed to recent developments in photonic machine learning and gain an overview about it. • Presenting science Participants are supported in developing a comprehensive and engaging narrative for presentations • Extracting information Participants will learn to extract relevant information from research papers in preparation for their literature review for their master's thesis. • Organization of information Participants learn to collect, organize and process information from scientific papers
7	Prerequisites	<p>I don't have background in machine learning, can I still participate?</p> <p>We do not expect a deep background in machine learning, however, expect a curious and proactive mentality to explore and learn new and unknown concepts.</p>
8	Integration in curriculum	no Integration in curriculum available!

5	Contents	<p>English Version:</p> <p>This module focuses on recent developments in image processing driven by medical applications. All algorithms are motivated by practical problems. The mathematical tools required to solve the considered image processing tasks will be introduced. The module starts with an overview on preprocessing algorithms such as scatter correction for x-ray images, edge detection, super-resolution and edge-preserving noise reduction. The second chapter describes automatic image analysis using feature descriptors, key point detection, and segmentation using bottom-up algorithms such as the random walker or top-down approaches such as active shape models. Furthermore, the module covers geometric calibration algorithms for single view calibration, epipolar geometry, and factorization. The last part of the module covers non-rigid registration based on variational methods and motion-compensated image reconstruction.</p> <p>Deutsche Version:</p> <p>Das Modul ist auf die jüngsten Entwicklungen in der Verarbeitung von medizinischen Bildern ausgerichtet. Alle Algorithmen werden durch praktische Probleme motiviert. Die mathematischen Werkzeuge, die für die Bildverarbeitungsaufgaben benötigt werden, werden eingeführt. Das Modul beginnt mit einem Überblick über Vorverarbeitungsalgorithmen, wie zum Beispiel Streustrahlkorrektur für Röntgenbilder, Kantenerkennung, Superresolution und kantenerhaltende Rauschunterdrückung. Das zweite Kapitel beschreibt die automatische Bildanalyse mit Merkmalsdeskriptoren, Punkterkennung und Segmentierung mit Bottom-up-Algorithmen wie dem Random-Walker oder Top-Down-Ansätzen wie aktiven Formmodellen. Darüber hinaus deckt die Vorlesung auch geometrische Kalibrierungsalgorithmen zur Einzelansicht-Kalibrierung, Epipolargeometrie und Faktorisierung ab. Der letzte Teil des Moduls deckt nicht-starre Registrierung auf der Grundlage von Variationsmethoden und bewegungskompensierter Bildrekonstruktion ab.</p>	
6	Learning objectives and skills	<p>English Version:</p> <p>The participants</p> <ul style="list-style-type: none"> summarize the contents of the lecture. 	

		<ul style="list-style-type: none"> • apply pre-processing algorithms such as scatter correction and edge-preserving filtering. • extract information from images automatically by image analysis methods such as key point detectors and segmentation algorithms. • calibrate projection geometries for single images and image sequences using the described methods. • develop non-rigid registration methods using variational calculus and different regularizers. • adopt algorithms to new domains by appropriate modifications. <p>Deutsche Version: Die Teilnehmenden</p> <ul style="list-style-type: none"> • fassen die Inhalte der Vorlesung zusammen. • wenden Vorverarbeitungsalgorithmen wie Streustrahlkorrektur und kantenerhaltende Filterung an. • extrahieren automatisch Informationen aus Bildern, indem sie Bildanalyseverfahren wie Punktdetektoren und Segmentierungsalgorithmen verwenden. • kalibrieren Projektionsgeometrien für Einzelbilder und Bildsequenzen mit den beschriebenen Methoden. • entwickeln nicht-starre Registrierungsmethoden mit Hilfe von Variationsrechnung und unterschiedlichen Regularisierern. • wenden Algorithmen auf neue Modalitäten durch entsprechende Änderungen im Algorithmus an.

5	Contents	<p>*Contents:* The course provides an introduction to quantum computing. The development of quantum hardware has progressed substantially in recent years and has now reached a level of maturity where first industrial applications are being explored. This course will introduce the fundamental ingredients of quantum algorithms, quantum bits and quantum gates, the most important hardware implementations and in particular algorithms that can run on near term hardware implementations of so called Noisy Intermediate Scale Quantum (NISQ) devices. The course will be completed with introductions to the basic concepts of error correction, which is needed in the next stage of development to fully exploit the potential of this emerging computing technology. Prerequisites: the main concepts of quantum theory, including quantum states, the Schrödinger equation, unitary evolution and measurements.</p>	
6	Learning objectives and skills	<p>*Learning goals and competences:*</p> <p>Students</p> <ul style="list-style-type: none"> • understand the origin of the computation potential of quantum computers • understand key quantum algorithms, such as Deutsch algorithm, quantum phase estimation and Shor's algorithm • understand the working principle of quantum error correction and key error correcting codes • code quantum algorithms in a modern quantum programming language • are able to apply the learned methodology to example problems

5	Contents	Deep Learning-based algorithms showed great performance in many fields of image processing and pattern recognition and compete with technologies such as compressive sensing and iterative optimization. The basis for the success of these algorithms is the availability of large amounts of data (big data) for training and of high computing power (typically GPUs). In this seminar, we try to explore advanced deep learning methods. In particular, we will aim to develop a deeper understanding of certain topics, for example, graph neural networks, unsupervised learning, differentiable learning, invertible learning, neural ordinary differential equations, transfer learning, multi-task learning, uncertainty DL, etc.
6	Learning objectives and skills	Students will be able to <ul style="list-style-type: none"> • perform their own literature research on a given subject • independently research this subject • present and introduce the subject to their student peers • give a scientific talk in English according to international conference standards

5	Contents	<p>This module naturally follows the "Basics of Lasers module and aims at deepen the knowledge on a few specific aspects of lasers. In particular we will study the Z-cavity of one of the most popular laser system: the Titanium: sapphire laser. The purpose here is to show why simpler cavity is not possible. It requires understanding properly the concept of stability of laser cavity and introduces the problem of astigmatism. In a second stage we see how dispersion effects can hamper the properties of a mode-locked laser system and see how to circumvent this. We then study the different method used to characterize ultrashort laser pulse. This starts from basics concepts of autocorrelation but review more advanced techniques allowing to retrieve fully the amplitude and phase of a laser pulse.</p> <p>Towards the end of the lecture several topics are possible and it will be chosen together with the students. This can be for instance (i) the polarization and the Jones formalism (ii) the Maxwell-Bloch equations (iii) the origin of spontaneous emission. Finally in order to broaden the contents of the lecture the students are asked to prepare one half-an-hour presentation of the topics of their choice. The topics are discussed during the first two sessions of the lecture and must focus on a physical aspect of laser.</p>
6	Learning objectives and skills	<p>Students</p> <ul style="list-style-type: none"> • Understand the problem of dispersion in a laser cavity and establish a strategy to balance this problem in order to achieve transform-limited ultrashort pulses • Estimate the duration of a laser pulse and adapt the technique to the level of precision required • Understand the design of laser cavities

5	Contents	<p>*Contents:* The course provides an introduction to quantum computing. The development of quantum hardware has progressed substantially in recent years and has now reached a level of maturity where first industrial applications are being explored. This course will introduce the fundamental ingredients of quantum algorithms, quantum bits and quantum gates, the most important hardware implementations and in particular algorithms that can run on near term hardware implementations of so called Noisy Intermediate Scale Quantum (NISQ) devices. The course will be completed with introductions to the basic concepts of error correction, which is needed in the next stage of development to fully exploit the potential of this emerging computing technology. Prerequisites: the main concepts of quantum theory, including quantum states, the Schrödinger equation, unitary evolution and measurements.</p>	
6	Learning objectives and skills	<p>*Learning goals and competences:*</p> <p>Students</p> <ul style="list-style-type: none"> • understand the origin of the computation potential of quantum computers • understand key quantum algorithms, such as Deutsch algorithm, quantum phase estimation and Shor's algorithm • understand the working principle of quantum error correction and key error correcting codes • code quantum algorithms in a modern quantum programming language • are able to apply the learned methodology to example problems 	
7	Prerequisites	None

5	Contents	<p>Course Advanced Experimental Physics: Lasers, Atomic Physics and Quantum Optics (EV-A)</p> <ul style="list-style-type: none"> • Introduction: Fundamental Properties and working scheme of the Laser, applications • Optical resonators: Ray transfer matrix analysis, stability criteria for optical resonators • Propagation of waves in optical media: Solutions to the wave equation, complex index of refraction, dispersion • Gaussian beams: Solution of the paraxial wave equation, Gaussian beams of higher order, properties of Gaussian beams, Gaussian beams and resonators, resonators as interferometer and spectrometer • Light-matter interaction: Classical description, semiclassical description, stimulated emission, black body radiation, interaction of a two-level atom with a monochromatic wave • Theory of the laser: Maxwell-Bloch-equations, laser operation in equilibrium, rate equations, outcoupled laser power, relaxation oscillations, micro-lasers, laser noise (Schawlow-Townes-Limit), generation and measurement of ultrashort pulses • Laser systems: Gas lasers, solid state lasers, vibronic lasers, laser frequency analysis and stabilization • Laser spectroscopy: Spectral lines + -profiles, broadening mechanisms, doppler-free spectroscopy • Cooling and trapping of atoms: Doppler cooling, magneto-optical trap, trapping of single atoms, Bose-Einstein-condensation

- Introduction to non-linear optics: Introduction to quantum optics, Hanbury-Brown-Twiss experiment, quantum nature of light, photon correlations, photon statistics, examples of non-classical light, bunching und antibunching of photons, resonance fluorescence

Course Advanced Experimental Physics: Particla and Astroparticle Physics (EV-B)

- Introduction: Interactions and exchange bosons, Feynman diagrams; relativistic kinematics with four- vectors
- Covariant description of spin-less particles: Free particles, spatial probability density, charge current density, equation of continuity; Klein-Gordon equation: Solutions for free particles, energy eigenvalues, interpretation by Feynman and Stückelberg; scattering on a static potential: Perturbative approach, transition matrix element, Fermi's Golden Rule
- Electrodynamics of spin-1/2 particles: Maxwell equations in covariant notation; Dirac equation (free particles, gamma matrices, spin, anti-particles, helicity, charge current density, equation of continuity); electron- muon scattering: Current-current interaction, photon propagator, Feynman rules, helicity conservation, spin averaging (without explicit calculation), differential cross section; electron-positron annihilation to muons or quarks, hadron/muon ratio R; decay width and its relation to matrix element and phase space factor; higher orders: Anomalous magnetic moment (g-2), charge renormalisation, running coupling constant
- Weak interactions: Charged current: (V-A) structure and parity violation, propagator, Fermi constant, quark mixing: Cabibbo angle, CKM matrix, its complex phase and CP violation, direct and indirect CP violation; massive neutrinos; Oscillations, PMNS matrix, oscillation phenomenology of solar, atmospheric and reactor neutrinos
- Neutral currents and electroweak unification: Weak isospin and hypercharge, $SU(2) \times U(1)$; electroweak coupling: Weinberg angle, Z- fermion-couplings
- Gauge theories and Higgs mechanism: Euler-Lagrange equation, global gauge invariance and current conservation: local gauge invariance and QED: Mass and interaction terms, photon field, spontaneous $U(1)$ symmetry breaking; Higgs mechanism for $U(1)$: Gauge freedom, Higgs mass and interaction terms, masses of $U(1) \times SU(2)$ gauge bosons (without explicit derivation); Higgs coupling to Standard Model particles, Higgs production and decay

Course Advanced Experimental Physics: Solid State Physics (EV-C)

- Crystal structures
- Structure determination
- Vibrational properties

		<ul style="list-style-type: none"> • Electronic structure • Electronic transport • Dielectric and optical properties • Magnetism • Superconductivity

5	Contents	<p>Das Modul hat zum Ziel, die Studierenden mit dem prinzipiellen Aufbau eines Mustererkennungssystems vertraut zu machen. Es werden die einzelnen Schritte von der Aufnahme der Daten bis hin zur Klassifikation von Mustern erläutert. Das Modul beginnt dabei mit einer kurzen Einführung, bei der auch die verwendete Nomenklatur eingeführt wird. Die Analog-Digital-Wandlung wird vorgestellt, wobei der Schwerpunkt auf deren Auswirkungen auf die weitere Signalanalyse liegt. Im Anschluss werden gebräuchliche Methoden der Vorverarbeitung beschrieben. Ein wesentlicher Bestandteil eines Mustererkennungssystems ist die Merkmalsextraktion. Verschiedene Ansätze zur Merkmalsberechnung/-transformation werden gezeigt, darunter Momente, Hauptkomponentenanalyse und Lineare Diskriminanzanalyse. Darüber hinaus werden Möglichkeiten vorgestellt, Merkmalsrepräsentationen direkt aus den Daten zu lernen. Das Modul schließt mit einer Einführung in die maschinelle Klassifikation. In diesem Kontext wird der Bayes- und der Gauss-Klassifikator besprochen.</p> <p>The module aims to familiarize students with the basic structure of a pattern recognition system. The individual steps from the acquisition of data to the classification of patterns are explained. The module starts with a short introduction, which also introduces the used nomenclature. Analog-to-digital conversion is introduced, with emphasis on its impact on further signal analysis. Common methods of preprocessing are then described. An essential component of a pattern recognition system is feature extraction. Various approaches to feature computation/transformation are demonstrated, including moments, principal component analysis, and linear discriminant analysis. In addition, ways to learn feature representations directly from the data are presented. The module concludes with an introduction to machine classification. In this context, the Bayes and Gauss classifiers are discussed.</p> <p>T</p>	
6	Learning objectives and skills	<p>Die Studierenden</p> <ul style="list-style-type: none"> • erklären die Stufen eines allgemeinen Mustererkennungssystems • verstehen Abtastung, das Abtasttheorem und Quantisierung • verstehen und implementieren Histogrammequalisierung und -dehnung 	

		<ul style="list-style-type: none"> • vergleichen verschiedene Schwellwertmethoden • verstehen lineare, verschiebungsinvariante Filter und Faltung • wenden verschiedene Tief- und Hochpassfilter sowie nichtlineare Filter an • wenden verschiedene Normierungsmethoden an • verstehen den Fluch der Dimensionalität • erklären verschiedene heuristische Merkmalsberechnungsmethoden, z.B. Projektion auf einen orthogonalen Basisraum, geometrische Momente, Merkmale basierend auf Filterung • verstehen analytische Merkmalsberechnungsmethoden, z.B. Hauptkomponentenanalyse, Lineare Diskriminanzanalyse • verstehen die Basis von Repräsentationslernen • erläutern die Grundlagen der statistischen Klassifikation (Bayes-Klassifikator) • benutzen die Programmiersprache Python, um die vorgestellten Verfahren der Mustererkennung anzuwenden • lernen praktische Anwendungen kennen und wenden die vorgestellten Algorithmen auf konkrete Probleme an <p>The students</p> <ul style="list-style-type: none"> • explain the stages of a general pattern recognition system • understand sampling, the sampling theorem, and quantization • understand and implement histogram equalization and expansion • compare different thresholding methods • understand linear, shift invariant filters and convolution • apply various low-pass, high-pass, and nonlinear filters • apply different normalization methods • understand the curse of dimensionality • explain different heuristic feature calculation methods, e.g. projection on an orthogonal base space, geometric moments, features based on filtering • understand analytical feature computation methods, e.g. principal component analysis, linear discriminant analysis • understand the basis of representation learning • explain the basics of statistical classification (Bayes classifier) • use the programming language Python to apply the presented pattern recognition methods • learn practical applications and apply the presented algorithms to concrete problems
7	Prerequisites	<p>Ein Mustererkennungssystem besteht aus den folgenden Stufen: Aufnahme von Sensordaten, Vorverarbeitung, Merkmalsextraktion und maschinelle Klassifikation. Dieses Modul beschäftigt sich in erster Linie mit den ersten drei Stufen und schafft damit die Grundlage für weiterführende Module (Pattern Recognition und Pattern Analysis).</p>

		A pattern recognition system consists of the following stages: Sensor Data Acquisition, Preprocessing, Feature Extraction, and Machine Classification. This module primarily deals with the first three stages and thus creates the basis for more advanced modules (Pattern Recognition and Pattern Analysis).

5	Contents	<p>This is a course introducing modern techniques of machine learning, especially deep neural networks, to an audience of physicists. Neural networks can be trained to perform diverse challenging tasks, including image recognition and natural language processing, just by training them on many examples. Neural networks have recently achieved spectacular successes, with their performance often surpassing humans. They are now also being considered more and more for applications in physics, ranging from predictions of material properties to analyzing phase transitions. We will cover the basics of neural networks, convolutional networks, autoencoders, restricted Boltzmann machines, and recurrent neural networks, as well as the recently emerging applications in physics. Prerequisites: almost none, except for matrix multiplication and the chain rule.</p>	
6	Learning objectives and skills	<ul style="list-style-type: none"> • explain the relevant topics of the lecture • apply methods to specific examples

5	Contents	<p>The lectures provide an overview of the most important methods for the statistical evaluation of measured data. It lays the foundation for bachelor and master theses in experimental physics. In the first part of the lectures we will deal with the basics of statistics and probability theory. The second part of the lectures provides an introduction to measurement error and error calculation, parameter estimates and confidence intervals. For some of the exercises we will use computer (python language), which will be useful for the data analysis in the context of a Bachelor / Master thesis.</p> <p>The topics will include:</p> <p>Part I. Probability and statistics</p> <ul style="list-style-type: none"> • Introduction to statistics and probability theory • Special distributions: Gaussian, Poisson, Multinomial • Parameter estimators of the distribution (mean, variance, bias etc.) • Multi-dimensional distributions • Random sampling <p>Part II. Statistical interpretation of measurements</p> <ul style="list-style-type: none"> • Least squared method • Chi2 fitting • Maximal likelihood • Bayesian statistics • Estimation of confidence intervals • Binned and unbinned analysis 	
6	Learning objectives and skills	<p>Students</p> <ul style="list-style-type: none"> • understand the basic concepts of probability and statistics • gain an understanding of the relevance of statistics for experimental data • learn how to statistically interpret data • understand how to chose the relevant statistical method 	
7	Prerequisites	<p>To successfully follow this lecture basic knowledge of Python is advantageous. Alternatively, participants should be willing to learn how to program alongside this class.</p> <p>It is recommended to first complete "Datenverarbeitung in der Physik (DV)".</p>

5	Contents	<p>Companies in all kinds of industries are producing and collecting rapidly more and more data from various sources. This is enabled by technologies such as the Internet of Things (IoT), Cyber-physical systems (CPS) and cloud computing. Hence, there is an increasing demand in industry and research for students and graduates with machine learning and data analytics skills in the Industry 4.0 context. The goal of this seminar is to give students insights about state-of-the-art machine learning and data analytics methods for industrial and business applications. In this seminar, the Industry 4.0 term will not only be limited to manufacturing processes, but comprise all business functions.</p> <p>Students will mainly work independently on either an implementation-centric or a research-centric topic. The implementation-centric topics will focus primarily on the implementation of algorithms and analytical components (using provided or open source datasets), while the research-centric topics will focus on researching and structuring literature of a specific field of interest. Several topics will be provided, but students are also encouraged to propose their own topics when applying for the seminar.</p> <p>In the regular meetings, students will learn about fundamentals and trends in Industry 4.0 from a machine learning perspective, common machine learning techniques and their implementation, project management of data analytics projects in businesses, as well as best practices for presentations and scientific work. The programme will be complemented by talks from invited experts in the domain. Furthermore, students will present results from literature research and data analytics projects.</p>	
6	Learning objectives and skills	<ul style="list-style-type: none"> • Students will develop an understanding of the current hot field of machine learning and data analytics in businesses • Students will learn to research and present a topic within the context of machine learning and data analytics in businesses independently • Students will learn to identify opportunities, challenges and limitations of corresponding ML approaches in businesses 	

		<ul style="list-style-type: none"> • Students will develop the skill to identify and understand relevant literature and to present their findings in a structured manner • Students will learn to present implementation and validation results in form of a demonstration and/or report
7	Prerequisites	<ul style="list-style-type: none"> • Prior knowledge of machine learning via courses like Pattern Analysis, Pattern Recognition, Deep Learning, Machine Learning for Time Series, or equivalent is expected. Alternatively, first data science project experience, for example as working student in a company, can be sufficient. • Motivation to explore scientific findings (e.g. via literature research) • Motivation to code and analyze data
