

Module description

for the degree programme

Master of Science Advanced
Materials and Processes

(Version of examination regulation: 20242)

for the winter term 2024/2025

Table of contents

Focus subject; Advanced processes

Focus subject: Biomaterials and bioprocessing

Focus subject: Computational materials science and process simulation

Elective course

Focal Subject Advanced Processes (42763).....	7
Focal Subject Advanced Processes (42764).....	8
Focal subject Biomaterials and bioprocessing (42765).....	9
Advanced Processes: Catalysis (42762).....	10
Fuel cells and electrolyzers (42918).....	12
Chemical Technologies for the Energy Transition (42939).....	14
Recycling of Electronic Wastes (42940).....	16
Adsorption: Fundamentals and applications (45035).....	18
Drying technology (45335).....	20
Advanced semiconductor technologies: Solution processed semiconductors II: Processing (46255).....	22
Advanced semiconductor technologies - Photovoltaic systems I - Fundamentals (46257).....	25
Process technologies (94351).....	27
Advanced applications: Tissue engineering (46264).....	29
Application of Cell Technology and Biofabrication (AppCT+BioFab) (94475).....	32
Computational Fluid Dynamics 1 (45471).....	34
Process simulation (42915).....	36
Focus subject Nanomaterials and nanotechnology	
Nanotechnology of disperse systems (45350).....	39
Self-organization processes (42936).....	42
Focal subject Biomaterials and bioprocessing (42766).....	44
Focal subject Biomaterials and bioprocessing (42767).....	45
Porous materials: Preparation principles, production processes and spectroscopic characterization (45045).....	46
Thin-film processing (42922).....	48

Focus subject; Advanced processes

Focus subject: Biomaterials and bioprocessing

Focus subject: Computational materials science and process simulation

Elective course

1	Module name 42763	Biomimetic Synthesis of Materials Focal Subject Advanced Processes	5 ECTS
2	Courses / lectures	No courses / lectures available for this module!	
3	Lecturers	No lecturers available since there are no courses / lectures for this module!	

4	Module coordinator	PD Dr. Stephan Wolf
5	Contents	no content description available!
6	Learning objectives and skills	no learning objectives and skills description available!
7	Prerequisites	None
8	Integration in curriculum	no Integration in curriculum available!
9	Module compatibility	Elective Course Master of Science Advanced Materials and Processes 20242 Focal Subject Biomaterials and Bioprocessing Master of Science Advanced Materials and Processes 20242
10	Method of examination	Written examination (90 minutes)
11	Grading procedure	Written examination (100%)
12	Module frequency	no Module frequency information available!
13	Workload in clock hours	Contact hours: ?? h (keine Angaben zum Arbeitsaufwand in Präsenzzeit hinterlegt) Independent study: ?? h (keine Angaben zum Arbeitsaufwand im Eigenstudium hinterlegt)
14	Module duration	?? semester (no information for Module duration available)
15	Teaching and examination language	english
16	Bibliography	

1	Module name 42764	Multi-scale Simulation Methods Focal Subject Advanced Processes	5 ECTS
2	Courses / lectures	No courses / lectures available for this module!	
3	Lecturers	No lecturers available since there are no courses / lectures for this module!	

4	Module coordinator	PD Dr. Paolo Moretti
5	Contents	no content description available!
6	Learning objectives and skills	no learning objectives and skills description available!
7	Prerequisites	None
8	Integration in curriculum	no Integration in curriculum available!
9	Module compatibility	Elective Course Master of Science Advanced Materials and Processes 20242 Focal Subject Computational Materials Science and Process Simulation Master of Science Advanced Materials and Processes 20242
10	Method of examination	Written examination (90 minutes)
11	Grading procedure	Written examination (100%)
12	Module frequency	no Module frequency information available!
13	Workload in clock hours	Contact hours: ?? h (keine Angaben zum Arbeitsaufwand in Präsenzzeit hinterlegt) Independent study: ?? h (keine Angaben zum Arbeitsaufwand im Eigenstudium hinterlegt)
14	Module duration	?? semester (no information for Module duration available)
15	Teaching and examination language	english
16	Bibliography	

1	Module name 42765	Atomistic Methods: phase diagrams and processes Focal subject Biomaterials and bioprocessing	5 ECTS
2	Courses / lectures	No courses / lectures available for this module!	
3	Lecturers	No lecturers available since there are no courses / lectures for this module!	

4	Module coordinator	Prof. Dr. Luca Ghiringhelli
5	Contents	no content description available!
6	Learning objectives and skills	no learning objectives and skills description available!
7	Prerequisites	None
8	Integration in curriculum	no Integration in curriculum available!
9	Module compatibility	Elective Course Master of Science Advanced Materials and Processes 20242 Focal Subject Computational Materials Science and Process Simulation Master of Science Advanced Materials and Processes 20242
10	Method of examination	Written examination (90 minutes)
11	Grading procedure	Written examination (100%)
12	Module frequency	no Module frequency information available!
13	Workload in clock hours	Contact hours: ?? h (keine Angaben zum Arbeitsaufwand in Präsenzzeit hinterlegt) Independent study: ?? h (keine Angaben zum Arbeitsaufwand im Eigenstudium hinterlegt)
14	Module duration	?? semester (no information for Module duration available)
15	Teaching and examination language	english
16	Bibliography	

1	Module name 42762	Advanced Processes: Catalysis	5 ECTS
2	Courses / lectures	No teaching units are offered for the module in the current semester. For further information on teaching units please contact the module managers.	
3	Lecturers	-	

4	Module coordinator	apl. Prof. Dr. Marco Haumann	
5	Contents	<ul style="list-style-type: none"> • Definition of sustainability and measures • Current and future Energy mix • Concepts of Catalysis • Exhaust Gas Catalysis • Sustainable Feedstocks • Biorefinery • Carbon capture and storage • Closing the C cycle: CO₂ as C1 Source • Alternative fuels • Chemical energy storage vs electrical storage 	
6	Learning objectives and skills	<p>The students</p> <ul style="list-style-type: none"> • learn important processes that contribute to the sustainability of the chemical industry, apart from energy processes. • learn what sustainability means • understand aspects of sustainability and are able to transfer it to future processes • understand the functionality and theory of common analysis tools for the characterization of catalytic systems • are able to show the advantages and disadvantages and the potentials of the reviewed applications 	
7	Prerequisites	No preliminary knowledge is needed for a successful participation. However, basic knowledge of catalysis, energy efficiency, thermodynamics, or reaction engineering can make it easier to get started.	
8	Integration in curriculum	no Integration in curriculum available!	
9	Module compatibility	Elective Course Master of Science Advanced Materials and Processes 20242 Focal Subject Advanced Processes Master of Science Advanced Materials and Processes 20242	
10	Method of examination	Written examination Graded scientific presentation (30 minutes).	
11	Grading procedure	Written examination (100%)	
12	Module frequency	Only in summer semester	
13	Workload in clock hours	Contact hours: 75 h Independent study: 75 h	
14	Module duration	1 semester	

15	Teaching and examination language	
16	Bibliography	<ul style="list-style-type: none">• Slides and all further material will be uploaded on StudOn.

1	Module name 42918	Fuel cells and electrolyzers	5 ECTS
2	Courses / lectures	No teaching units are offered for the module in the current semester. For further information on teaching units please contact the module managers.	
3	Lecturers	-	

4	Module coordinator	Prof. Dr.-Ing. Simon Thiele	
5	Contents	Fuel cell (FC) and electrolysis cell (ECs) <ul style="list-style-type: none"> • Application areas • Thermodynamic boundary conditions • Electrochemical basics • Kinetics • Transport processes • State of the art • Characterisation techniques • Open questions and scientific challenges 	
6	Learning objectives and skills	Students <ul style="list-style-type: none"> • are able to apply acquired knowledge from e.g. physical chemistry, mathematics and basic electrochemistry • understand kinetics to describe the time dependent concentration changes in chemical reactions • apply basic knowledge in thermodynamics and general chemistry • are familiar with basic concepts of electrochemical engineering for fuel cells and electrolyzers • can describe thermodynamics, kinetic effects and electrochemical foundations • understand limitations such as kinetic, ohmic or mass transport limitations • have a solid knowledge on the state of the art • know how to experimentally characterize cells • are able to deduce methods to improve cell technologies by analyzing experimental data 	
7	Prerequisites	To succeed in this course, students will need to apply acquired knowledge from e.g. physical chemistry, mathematics and basic electrochemistry. Understanding of kinetics to describe the time dependent concentration changes in chemical reactions should be familiar from physical chemistry classes. Basic knowledge in thermodynamics and general chemistry is beneficial.	
8	Integration in curriculum	semester: 1;2;3;4	
9	Module compatibility	Elective Course Master of Science Advanced Materials and Processes 20242 Focal Subject Advanced Processes Master of Science Advanced Materials and Processes 20242	
10	Method of examination	Variable (120 minutes)	

		written exam (120 min.)
11	Grading procedure	Variable (100%)
12	Module frequency	Only in winter semester
13	Workload in clock hours	Contact hours: 75 h Independent study: 75 h
14	Module duration	1 semester
15	Teaching and examination language	english
16	Bibliography	<ul style="list-style-type: none"> O'hayre, Ryan; Cha, Suk-Won; Prinz, Fritz B.; Colella, Whitney (2016): Fuel cell fundamentals: John Wiley & Sons.

1	Module name 45035	Adsorption: Fundamentals and Applications Adsorption: Fundamentals and applications	5 ECTS
2	Courses / lectures	No teaching units are offered for the module in the current semester. For further information on teaching units please contact the module managers.	
3	Lecturers	-	

4	Module coordinator	Prof. Dr. Matthias Thommes	
5	Contents	1. Introduction and terminology 2. Gas adsorptions basics and adsorbent materials 3. Physisorption mechanisms 4. Surface area determination 5. Porosity and pore structure analysis of nanoporous materials 5.1 Micropore analysis 5.2 Mesopore analysis 5.3 Macropore analysis : adsorption and liquid intrusion methods 5.4. Characterization of hierarchically structured porous materials 6. High pressure adsorption 7. Surface chemistry effects on adsorption 8. Adsorption and characterization in the liquid phase 9. Adsorption of mixtures 10. Adsorption applications in gas storage and separation	
6	Learning objectives and skills	The students will achieve a deep understanding of the underlying mechanisms for the adsorption of fluids on powders and nanoporous materials know adsorption-based and complimentary techniques/methodologies for a reliable characterization of adsorbents for applications in separation, heterogeneous catalysis etc. understand the basics of high pressure adsorption and corresponding applications in gas storage know selected, important principles of adsorption-based separation processes	
7	Prerequisites	None	
8	Integration in curriculum	semester: 3	
9	Module compatibility	Elective Course Master of Science Advanced Materials and Processes 20242 Focal Subject Advanced Processes Master of Science Advanced Materials and Processes 20242	
10	Method of examination	Written or oral Oral examination (30 min.)	
11	Grading procedure	Written or oral (100%)	
12	Module frequency	Only in winter semester	
13	Workload in clock hours	Contact hours: 45 h Independent study: 105 h

1	Module name 46255	Advanced Semiconductor Technologies Solution Processed Semiconductors II - Processing Advanced semiconductor technologies: Solution processed semiconductors II: Processing	5 ECTS
2	Courses / lectures	Vorlesung mit Übung: Advanced Semiconductor Technologies - Processing (including Lab Work Organic Electronics Processing) (2 SWS, SoSe 2025)	3 ECTS
3	Lecturers	Dr. Larry Lürer	

4	Module coordinator	Hans-Joachim Egelhaaf	
5	Contents	<p>Lecture / Exercise / Lab work</p> <p>The lecture will give an introduction to coating and printing technologies for the manufacturing of (opto-)electronic devices by solution processing. Special emphasis will be on upscaling from lab scale devices to large area commercial products. The fundamentals of the different technologies as well as their application for the manufacturing of active layers, transparent electrodes and transparent barriers will be described in detail. Exercises will provide a more quantitative approach to thin film processing while lab work will allow hands on experience of the lecture content.</p>	
6	Learning objectives and skills	<ul style="list-style-type: none"> • The students will be introduced to the inventory of printing, coating and patterning technologies available for the solution processing of organic, hybrid and inorganic (opto-)electronic devices (FETs, LEDs, solar cells and photodetectors) and its application to the manufacturing of organic, perovskite and quantum dot devices. • After discussing the fundamentals of wet film deposition (wetting, viscosity, drying), the working principles and application ranges of coating (spin coating, doctor blading, slot die coating), printing (letter press, gravure, flexo, screen, ink jet printing) as well as of patterning techniques (printing, scratching, laser ablation) will be introduced. • The specific requirements of "printed electronics will be introduced and compared to those of "silicon based electronics on one hand and "visual printing on the other hand. • The students will learn how to manufacture transparent electrodes (thin metal films, finger electrodes, nanowire meshes, transparent conductive oxides), active layers (bulk heterojunctions, perovskite films, nanoparticle layers), and barriers from the respective inks. They will also learn how to decide for the appropriate coating/printing technology. The inventory of materials for printed electronics will be presented and concepts for rational development of inks from these materials (Hansen solubility theory) will be introduced. • Exercises will teach the students to base their decisions for materials, coating/printing technologies and patterning methods on quantitative considerations. These will include the 	

		<p>calculation of resistance losses in transparent electrodes, of the viscosities and surface tensions of inks as well as of the water vapor transmission rates of barriers.</p> <ul style="list-style-type: none"> • Deposition and patterning of electrodes, active layers, and barriers for organic or perovskite solar cells will be trained in the lab work.
7	Prerequisites	Bachelor in Material Science, Nanotechnology, Energy Technology, Electronic Engineering, Computer Science, Physics, Chemistry, Chemical Engineering, Nanotechnologie, Energietechnik, Elektrotechnik, Physik, Chemie or comparable
8	Integration in curriculum	semester: 1
9	Module compatibility	<p>Elective Course Master of Science Advanced Materials and Processes 20242 Focal Subject Advanced Processes Master of Science Advanced Materials and Processes 20242</p> <p>Usability of the module / integration into the sample curriculum:</p> <p>1) Materialwissenschaft und Werkstofftechnik (Master of Science) (Po-Vers. 2020w TechFak Materialwissenschaft und Werkstofftechnik (Master of Science) Kernfach 1 Materialien der Elektronik und der Energietechnologie weitere Wahlmodule Advanced Semiconductor Technologies – Solution Processed Semiconductors II - Processing)</p> <p>2) Materialwissenschaft und Werkstofftechnik (Master of Science) (Po-Vers. 2020w TechFak Materialwissenschaft und Werkstofftechnik (Master of Science) Kernfach 2 und 3 Materialien der Elektronik und der Energietechnologie weitere Wahlmodule Advanced Semiconductor Technologies – Solution Processed Semiconductors II - Processing)</p> <p>3) Materialwissenschaft und Werkstofftechnik (Master of Science) (Po-Vers. 2020w TechFak Materialwissenschaft und Werkstofftechnik (Master of Science) 1. und 2. 4	Module coordinator	Prof. Dr. Christoph Brabec Prof. Dr. Wolfgang Hei
5	Contents	Lecture / Exercise / Lab work The lecture will introduce into the fundamentals of photovoltaic energy conversion. The conversion of light into electricity is one of the most efficient power technologies by today and is expected to transform our energy system towards a renewable scenario. The limits of photovoltaic energy conversion, the materials and architectures of major PV technologies and advanced characterization methods for modules as well as solar fields will be introduced theoretically and experimentally during the lecture, a seminar and the lab works.
6	Learning objectives and skills	<ul style="list-style-type: none"> The students will learn the concept of black body radiation and the radiation laws and the limits of light energy conversion. The fundamental semiconductor junctions (p-n, M-i-M, Schottky and Hetero Junction) are repeated. The one diode and two diodes replacement circuits are explained. Electrical, optical, recombination and extraction loss mechanisms are discussed separately and demonstrated at the hand of numerical drift-diffusion equation solvers. The most important solar cell concepts (Si, CIGS, CdTe, GaAs, Perovskites, Organics) are introduced, and the strengths and weaknesses of each technology are analysed. Characterization of Photovoltaic Modules will be trained by flashed measurements in the lab. Defect imaging methods like DLIT, EL or PL imaging will be trained at the hand of module installations in Erlangen.
7	Prerequisites	Bachelor in Material Science, Nanotechnology, Energy Technology, Electronic Engineering, Computer Science, Physics, Chemistry, Chemical Engineering, or comparable
8	Integration in curriculum	semester: 1
9	Module compatibility	Elective Course Master of Science Advanced Materials and Processes 20242 Focal Subject Advanced Processes Master of Science Advanced Materials and Processes 20242

4	Module coordinator	Prof. Dr.-Ing. Bastian Etzold	
5	Contents	<p>The Module "Process Technologies gives an overview on important processes in the chemical process industries. The processes are treated in a holistic approach and the interaction of individual process steps and their feedback to the overall process are discussed in more detail. In particular, the relationship between the physical/chemical basics of the processes, process development and process design are discussed. The presented processes are selected based on their importance in the fields of raw materials, intermediates and consumer products of the chemical process industries. In the sense of process engineering, apart from the reaction steps, the separation operations are also part of the considerations. The evaluation of the methods with regard to their cost-effectiveness and sustainability complete the description of the processes. In detail, the following aspects are treated:</p> <ul style="list-style-type: none"> • Raw materials (crude oil, fuels, natural gas, technical gases) • Organic base chemicals (syngas, alkanes, alkenes, aromatics) • Organic intermediates (C1-C4 alcohols, cyclic alcohols, ether, epoxides, organic acids) • Renewable raw materials • Organic end products (surfactants, pigments, polymers) • Inorganic base chemicals and intermediates (sulfuric acid, ammonia, sodium hydroxide) • Inorganic end products (fertilizers, ceramics, glass) • Process development (technologies, economic evaluation) 	
6	Learning objectives and skills	<p>The students</p> <ul style="list-style-type: none"> • know the important processes in the chemical process industries • describe the interaction of individual process steps and their feedback to the overall process • discuss the relationship between the physical/chemical basics of the processes, process development and process design • evaluate the processes und methods with regard to their cost-effectiveness and sustainability

Praktikum "Tissue Engineering"

[Versuch 1: Polymer-beschichtete bioaktive Scaffolds für Knochen Tissue Engineering]

Die Studenten

- lernen kennen und wenden an: Herstellungsverfahren, Beschichtungsverfahren und Charakterisierungsmethoden für scaffold für Knochen-TE.
- können: Ein Protokoll der Experimente erstellen.
- bewerten und diskutieren: Die Verfahren und Ergebnisse der Versuche.

[Versuch 2: Elektrophoretische Abscheidung von Funktionsschichten auf Biomaterialien]

Die Studenten

- lernen kennen: Die Anforderungen an Biomaterialien, den Einfluss der EPD-Abscheidungsparameter auf die Funktionalität der Schichten.
- lernen kennen und wenden an: Das Verfahren der Elektrophoretischen Abscheidung, die Kontaktwinkelmessung als Charakterisierungsmethode von Oberflächen.
- bewerten und diskutieren: Funktionsschichten bezüglich Ihres Einsatzes als Biomaterialien; die Ergebnisse der Versuche und Verfahren.

[*Educational objectives and competences:*

Biomaterials for Tissue Engineering

The students need to

- comprehend the paramount importance of the concepts of tissue engineering and the role of biomaterials therein.
- to be familiar with the significance, fabrication, characterisation, application and evaluation of scaffold structures for tissue engineering.

Practical "Tissue engineering"

[Experiment 1:] Polymer coated bioactive scaffolds for bone tissue engineering

The students

- are familiarised with and apply: fabrication methods, coating techniques and characterisation methods for scaffolds for bone tissue engineering.
- are able to: devise a protocol of the experiment.
- assess and discuss: the procedures and results of the experiments.

[Experiment 2:] Electrophoretic deposition (EPD) of functional coatings on biomaterials

The students

- get to know: the requirements for biomaterials, the influence of the EPD-process parameters on the functionality of the coatings.

		<ul style="list-style-type: none"> • apply: the processes of EPD, contact angle measurements as a characterisation method for surfaces. • assess and discuss: functional coatings regarding their application as biomaterials, the results of the experiments and the process in general.
7	Prerequisites	None
8	Integration in curriculum	semester: 1
9	Module compatibility	Elective Course Master of Science Advanced Materials and Processes 20242 Focal Subject Biomaterials and Bioprocessing Master of Science Advanced Materials and Processes 20242
10	Method of examination	Variable (45 minutes) derzeit mündliche Prüfung (15 Minuten) currently taking an oral exam (15 minutes)
11	Grading procedure	Variable (100%)
12	Module frequency	Only in summer semester

1	Module name 94475	Application of Cell Technology and Biofabrication Application of Cell Technology and Biofabrication (AppCT+BioFab)	5 ECTS
2	Courses / lectures	No teaching units are offered for the module in the current semester. For further information on teaching units please contact the module managers.	
3	Lecturers	-	

4	Module coordinator	Prof. Dr.-Ing. Aldo Boccaccini	
5	Contents	This course introduces the basics of biochemistry, cells and cell culture technique. Based on this knowledge, the students will learn how cells interact with biomaterials and how material parameters are influencing protein adsorption, cell adhesion, proliferation and differentiation. Also techniques to study these interactions are discussed in this course. With regards to biomedical engineering, characteristics of cell lines, primary and stem cells are further focal points. To understand the different approaches of tissue engineering, materials, growth factors and bioreactors will be discussed. Based on different hard and soft tissue examples, angiogenesis and tissue regeneration will be focused. Furthermore, students will learn basics about additive manufacturing, hydrogels and cellprinting. This leads to the field of biofabrication.	
6	Learning objectives and skills	The students have the knowledge of the application of cell tissue technologies for tissue engineering in medicine and biomedicine. The students can apply basic research methods e.g. application of cell based interdisciplinary research topics. As the students will discuss current research projects, students are able to interpret and evaluate in vitro data from several biomedical research studies.

5	Contents	<p>In diesem Modul sollen wichtige spektroskopische Verfahren und ihre Anwendungsbereiche vorgestellt werden. Im ersten Teil der Veranstaltung wird eine kurze Einführung in die molekularen Grundlagen sowie der Eigenschaften elektromagnetischer Strahlung gegeben. Zunächst werden die Prinzipien der Methoden zur Strukturaufklärung auf molekularer Ebene besprochen, insbesondere der Resonanzmethoden wie Kernresonanz- (NMR-), Elektronenspinresonanz- (ESR-) Ultraviolett- (UV-), Infrarot- (IR-) und Raman-Spektroskopie. Im zweiten Teil der Veranstaltung wird die Charakterisierung von technischen Katalysatoren und Adsorbenten vorwiegend mittels Festkörper-NMR-Spektroskopie und ESR-Spektroskopie (unter Einbeziehung von IR- und UV-Spektroskopie) anhand verschiedener Beispiele konkret geübt. Dabei werden neben den Grundlagen der Spektroskopie von Feststoffen auch die verschiedenen Aspekte der In-situ-(Operando)-Spektroskopie und der Prozessanalytik mittels spektroskopischer Methoden konkreter vorgestellt. Die Lehrveranstaltungen dieses Moduls sind Vorlesungen, Übungen und ein Praktikum. In den Vorlesungen werden die erforderlichen theoretischen Grundlagen für das Verständnis spektroskopischer Methoden vermittelt. Eng mit dem Vorlesungsstoff verzahnt werden in den Übungsgruppen und im Praktikum die Fähigkeit zur Aufnahme und Interpretation realer Spektren an Hand von Beispielen aus der Technik (z.B. Zeolithe, geträgerte Metallkatalysatoren, immobilisierte Enzyme) geübt.</p>
6	Learning objectives and skills	<p>Die Studierenden:</p> <ul style="list-style-type: none"> • verstehen die molekularen Grundlagen sowie der Eigenschaften elektromagnetischer Strahlung • kennen die wichtigsten spektroskopischen Methoden und ihre Anwendung zur Charakterisierung von technischen Feststoffen, insbesondere Resonanzmethoden wie Kernresonanz- (NMR-), Elektronenspinresonanz- (ESR-) Ultraviolett- (UV-), Infrarot- (IR-) und Raman-Spektroskopie • wenden die theoretischen Aspekte in vielfältigen spezielleren, aber auch kombinierten Übungen zur Charakterisierung von technischen Katalysatoren und Adsorbenten mittels Festkörper-NMR-Spektroskopie und ESR-Spektroskopie (unter Einbeziehung von IR- und UV-Spektroskopie) an

		<ul style="list-style-type: none"> • können Spektren selbstständig aufnehmen und an Hand von Beispielen aus der Technik (z.B. Zeolithe, geträgerte Metallkatalysatoren, immobilisierte Enzyme) interpretieren und die Ergebnisse kritisch bewerten
